(54) Title: THIAZOLE DERIVATIVES AND THEIR USE AS VAP-1 INHIBITORS

(57) Abstract: A compound of the formula (I):  $R^1-NH-X-Y-Z$  (I) wherein  $R^1$  is acyl; X is a bivalent residue derived from optionally substituted thiazole; Y is a bond, lower alkylene or  $-COHN-$ ; and Z is a group of the formulae (II) or (III) wherein  $R^2$  is a specified substituent or a pharmaceutically acceptable salt thereof useful as a vascular adhesion protein-1 (VAP-1) inhibitor for preventing or treating a VAP-1-associated disease, especially macular edema.

## THIAZOLE DERIVATIVES AND THEIR USE AS VAP-1 INHIBITORS

The present invention relates to a compound or a  
5 pharmaceutically acceptable salt thereof useful as a vascular  
adhesion protein-1 inhibitor, a pharmaceutical composition  
comprising the compound or salt thereof as an active  
ingredient, a method for preventing or treating a vascular  
adhesion protein-1 associated disease, especially macular  
10 edema, use of the compound, salt thereof or composition, and  
the like.

## BACKGROUND ART

Vascular adhesion protein-1 (hereinafter to be  
abbreviated as VAP-1) is an amine oxidase (semicarbazide  
15 sensitive amine oxidase, SSAO) which is abundant in human  
plasma, and shows remarkably increased expression in  
vascular endothelium and vascular smooth muscle of the  
inflammatory region. While the physiological role of VAP-1  
has not been clarified until recently, VAP-1 gene was cloned  
20 in 1998, and VAP-1 has been reported to be a membrane  
protein that regulates rolling and migration of lymphocyte  
and NK cell as an adhesion molecule under regulation of  
expression by inflammatory cytokine. Although the amine to  
be a substrate is unknown, it is considered to be  
25 methylamine generated in any part of living organisms. It is  
also known that hydrogen peroxide and aldehydes produced due  
to the amine oxidase activity in the molecule are important  
factors of adhesion activity.

A recent report has documented that VAP-1 enzyme  
30 activity in plasma increases in diabetic patients, whether  
type I or type II, and the increase is particularly  
remarkable in diabetic patients suffering from retinopathy  
complications (Diabetologia, 42 (1999) 233-237, Diabetic

Medicine, 16 (1999) 514-521).

In addition, it has been reported that VAP-1 is associated with the following diseases:

- (1) cirrhosis, essential stabilized hypertension, diabetes, arthrosis (see JP-A-61-239891 and USP 4,888,283);
- (2) endothelium damage (in diabetes, atherosclerosis and hypertension), a cardiovascular disorder associated with diabetes and uraemia, pain associated with gout and arthritis, retinopathy (in diabetes patients) (see WO 93/23023);
- 10 (3) an (connective tissue) inflammatory disease or condition (rheumatoid arthritis, ankylosing spondylitis, psoriatic arthritis and osteoarthritis or degenerative joint disease, Reiter's syndrome, Sjögren's syndrome, Behçet's syndrome, relapsing polychondritis, systemic lupus erythematosus, discoid lupus erythematosus, systemic sclerosis, eosinophilic fasciitis, polymyositis, dermatomyositis, polymyalgia rheumatica, vasculitis, temporal arteritis, polyarteritis nodosa, Wegener's granulomatosis, mixed connective tissue disease, and juvenile rheumatoid arthritis); a
- 20 gastrointestinal inflammatory disease or condition [Crohn's disease, ulcerative colitis, irritable bowel syndrome (spastic colon), fibrotic conditions of the liver, inflammation of the oral mucosa (stomatitis), and recurrent aphtous stomatitis]; a central nervous system inflammatory disease or condition
- 25 (multiple sclerosis, Alzheimer's disease, and ischaemia-reperfusion injury associated with ischemic stroke); a pulmonary inflammatory disease or condition (asthma, adult respiratory distress syndrome, chronic obstructive pulmonary disease); a (chronic) skin inflammatory disease or condition
- 30 (psoriasis, allergic lesions, lichen planus, pityriasis rosea, contact dermatitis, atopic dermatitis, pityriasis rubra pilaris); a disease related to carbohydrate metabolism (diabetes and complications from diabetes) including

microvascular and macrovascular disease (atherosclerosis, vascular retinopathies, retinopathy, nephropathy, nephrotic syndrome and neuropathy (polyneuropathy, mononeuropathies and autonomic neuropathy), foot ulcers, joint problems, and increased risk of infection); a disease related to aberrations in adipocyte differentiation or function or smooth muscle cell function (atherosclerosis and obesity); a vascular disease [atheromatous atherosclerosis, nonatheromatous atherosclerosis, ischemic heart disease including myocardial infarction and peripheral arterial occlusion, Raynaud's disease and phenomenon, thromboangiitis obliterans (Buerger's disease)]; chronic arthritis; inflammatory bowel diseases; skin dermatoses (see WO 02/02090, WO 02/02541 and US patent application publication No. 2002/0173521 A1); (4) diabetes mellitus (see WO 02/38152); and (5) SSAO-mediated complication [diabetes (insulin dependent diabetes mellitus (IDDM) and non-insulin dependent diabetes mellitus (NIDDM)) and vascular complication (heart attack, angina, strokes, amputations, blindness and renal failure)] (see WO 02/38153), and the like.

Under the present circumstances, a drug treatment or prophylaxis of the above diseases has been demanded.

Macular edema is a common ocular abnormality resulting from a vast etiology and characterized by perturbation of the integrity of the blood-retinal barrier of the perifoveal capillaries and the optic nerve head. Macular edema is known to include diabetic and non-diabetic ones. Macular edema as a diabetic complication is a disease state that can occur in any stage of diabetic retinopathy, emerges before the onset of neovascularization and causes a serious visual disorder. Macular area is a highly evolved part in retina and plays a key role in controlling the eyesight. Once the macular area suffers from edema, how mild the change may be, it causes a

significant failure of eyesight, and when left unattended, the edema causes irreversible changes of macular tissue, and it is considered to encourage progress of retinopathy.

At present, for macular edema, laser beam  
5 photocoagulation and vitreous surgery have been tried as a symptomatic therapy. However, irradiation of laser on the macular area is not easy and unnecessary laser treatments may produce side effects (e.g., possible encouragement of edema by causing inflammation). The vitreous surgery is  
10 considered to provide effect in 70 percent of macular edema, but physical and economical burden on patients is high, and the incidence of recurrence is also high. These treatment methods are not usually employed in the initial stage of macular edema, particularly so in the stages when the  
15 decrease of vision is comparatively small. Accordingly, a drug treatment comparatively easily applicable from the early stages of the disease has been also demanded under the present circumstances.

#### DISCLOSURE OF INVENTION

20 The present inventors have intensively worked on the problem of drug treatment of a VAP-1 associated disease and found that a VAP-1 inhibitor is useful for the prophylaxis or treatment of the disease, particularly macular edema, and completed the present invention. Thus, the present invention  
25 provides the following.

#### DETAILED DESCRIPTION OF THE INVENTION

The present invention is predicated on the discovery that an inhibitor of vascular adhesion protein-1 (VAP-1; also referred to as semicarbazide sensitive amine oxidase (SSAO) or copper-containing amine oxidase) is effective in  
10 treating or ameliorating a VAP-1 associated disease, especially macular edema, and the like. Accordingly, the present invention provides Compound (I) or a pharmaceutically acceptable salt thereof useful as a VAP-1 inhibitor, a pharmaceutical composition, a method for preventing or  
15 treating a VAP-1 associated disease, and the like.

In the above and subsequent descriptions of the present specification, suitable examples and illustration of the various definitions to be included within the scope of the invention are explained in detail as follows.

20 Suitable "halogen" includes fluorine, chlorine, bromine and iodine.

The term "lower" is used to intend a group having 1 to 6, preferably 1 to 4, carbon atom(s), unless otherwise provided.

25 Suitable "lower alkyl" includes straight or branched alkyl having 1 to 6 carbon atom(s), such as methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl, tert-butyl, pentyl, tert-pentyl and hexyl, in which more preferred one is C<sub>1</sub>-C<sub>4</sub> alkyl.

30 Suitable "lower alkylthio" includes lower alkylthio containing the above lower alkyl, such as methylthio, ethylthio, propylthio, isopropylthio, butylthio, isobutylthio, sec-butylthio, tert-butylthio, pentylthio,

tert-pentylthio and hexylthio.

Suitable "lower alkylene" includes straight or branched alkylene having 1 to 6 carbon atom(s), such as methylene, ethylene, trimethylene, tetramethylene, propylene,  
5 ethylidene and propylidene, in which more preferred one is C<sub>1</sub>-C<sub>4</sub> alkylene.

Suitable "lower alkenylene" includes straight or branched alkenylene having 2 to 6 carbon atom(s), such as -CH=CH-, -CH<sub>2</sub>-CH=CH-, -CH<sub>2</sub>-CH=CH-CH<sub>2</sub>-, -CH<sub>2</sub>-CH<sub>2</sub>-CH=CH-,  
10 -CH=CH-CH=CH-, -CH=CH-CH<sub>2</sub>-CH<sub>2</sub>-CH<sub>2</sub>-, -CH=CH-CH=CH-CH<sub>2</sub>-CH<sub>2</sub>- and -CH=CH-CH=CH-CH=CH-, in which more preferred one is C<sub>2</sub>-C<sub>4</sub> alkenylene.

The above lower alkenylene may be in E or Z form, respectively. Thus, those skilled in the art will recognize  
15 that the lower alkenylene includes all E, Z-structures when it has 2 or more double bonds.

Suitable "aryl" includes C<sub>6</sub>-C<sub>10</sub> aryl such as phenyl and naphthyl, in which more preferred one is phenyl. The "aryl" may be substituted by 1 to 3 substituent(s) and the

20 the administration of VAP-1 inhibitor in the present  
invention, which is specifically various animals such as

25 in an amount sufficient to treat the VAP-1 associated  
disease, especially macular edema. Any VAP-1 inhibitor can  
be used in the method of the present invention as long as it  
is safe and efficacious. Herein, "VAP-1 inhibitor" will be  
used to refer to such compounds, which include Compound (I),  
30 and is intended to encompass all compounds that inhibit

The term "derivative" is intended to include all compounds derived from the original compound.

In the present invention, the VAP-1 inhibitor can be administered as a prodrug to a subject. The term "prodrug" is intended to include all compounds that convert to the VAP-1 inhibitor in the body of administration subject. The prodrug can be any pharmaceutically acceptable prodrug of VAP-1 inhibitor. Moreover, the VAP-1 inhibitor can be administered to an administration subject as a pharmaceutically acceptable salt.

The pharmaceutically acceptable salt of VAP-1 inhibitor of the present invention is nontoxic and a pharmaceutically acceptable conventional salt, which is exemplified by salts with inorganic or organic base such as alkali metal salt (e.g., sodium salt, potassium salt and the like), alkaline earth metal salt (e.g., calcium salt, magnesium salt and the like), ammonium salt, and amine salt (e.g., triethylamine salt, N-

benzyl-N-methylamine salt and the like).

The VAP-1 inhibitor can be also formulated as a pharmaceutically acceptable acid addition salt. Examples of the pharmaceutically acceptable acid addition salts for use in  
5 the pharmaceutical composition include those derived from mineral acids, such as hydrochloric, hydrobromic, hydriodic, phosphoric, metaphosphoric, nitric and sulfuric acids, and organic acids, such as tartaric, acetic, citric, malic, lactic, fumaric, benzoic, glycolic, gluconic, succinic and  
10 arylsulfonic acids, for example, p-toluenesulfonic acid.

As a pharmaceutically acceptable salt of VAP-1 inhibitor represented by the formula (I), a pharmaceutically acceptable acid addition salt such as (mono-, di- or tri-)hydrochloride and hydriodide, particularly hydrochloride, is preferable.

15 The above-mentioned VAP-1 inhibitor may be commercially available or can be produced based on a known reference.

Also, Compound (I), particularly Compound A: N-{4-[2-(4-{[amino(imino)methyl]amino}phenyl)ethyl]-1,3-thiazol-2-yl}acetamide, can be synthesized according to the Production  
20 Method given below.

Those compounds or derivatives thereof that are not commercially available can be prepared using organic synthetic methods known in the art.

The VAP-1 inhibitor or a pharmaceutically acceptable  
25 salt thereof can be administered in accordance with the present inventive method by any suitable route. Suitable routes of administration include systemic, such as orally or by injection, topical, periocular (e.g., subTenon's), subconjunctival, intraocular, subretinal, suprachoroidal and  
30 retrobulbar administrations. The manner in which the VAP-1 inhibitor is administered is dependent, in part, upon whether the treatment of a VAP-1 associated disease is prophylactic or therapeutic.

The VAP-1 inhibitor is preferably administered as soon as possible after it has been determined that a subject such as mammal, specifically a human, is at risk for a VAP-1 associated disease (prophylactic treatments) or has begun to  
5 develop a VAP-1 associated disease (therapeutic treatments). Treatment will depend, in part, upon the particular VAP-1 inhibitor to be used, the amount of the VAP-1 inhibitor to be administered, the route of administration, and the cause and extent, if any, of a VAP-1 associated disease realized.

10 One skilled in the art will appreciate that suitable methods of administering a VAP-1 inhibitor, which is useful in the present inventive method, are available. Although more than one route can be used to administer a particular VAP-1 inhibitor, a particular route can provide a more  
15 immediate and more effective reaction than another route. Accordingly, the described routes of administration are merely exemplary and are in no way limiting.

The dose of the VAP-1 inhibitor administered to the administration subject such as animal including human,  
20 particularly a human, in accordance with the present invention should be sufficient to effect the desired response in the subject over a reasonable time frame. One skilled in the art will recognize that dosage will depend upon a variety of factors, including the strength of the  
25 particular VAP-1 inhibitor to be employed, the age, species, conditions or disease states, and body weight of the subject, as well as the degree of a VAP-1 associated disease. The size of the dose also will be determined by the route, timing and frequency of administration as well as the  
30 existence, nature, and extent of any adverse side effects that might accompany the administration of a particular VAP-1 inhibitor and the desired physiological effect. It will be appreciated by one of ordinary skill in the art that various

conditions or disease states may require prolonged treatment involving multiple administrations.

Suitable doses and dosage regimens can be determined by conventional range-finding techniques known to those of  
5 ordinary skill in the art. Generally, treatment is initiated with smaller dosages, which are less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached.

10 Generally, the VAP-1 inhibitor can be administered in the dose of from about 1  $\mu\text{g/kg/day}$  to about 300  $\text{mg/kg/day}$ , preferably from about 0.1  $\text{mg/kg/day}$  to about 10  $\text{mg/kg/day}$ , which is given in a single dose or 2 to 4 doses a day or in a sustained manner.

15 Pharmaceutical compositions for use in the present inventive method preferably comprise a "pharmaceutically acceptable carrier" and an amount of a VAP-1 inhibitor sufficient to treat a VAP-1 associated disease, especially macular edema, prophylactically or therapeutically as an  
20 active ingredient. The carrier can be any of those conventionally used and is limited only by chemico-physical considerations, such as solubility and lack of reactivity with the compound, and by the route of administration.

The VAP-1 inhibitor can be administered in various  
25 manners to achieve the desired VAP-1 inhibitory effect. The VAP-1 inhibitors can be administered alone or in combination with pharmaceutically acceptable carriers or diluents, the properties and nature of which are determined by the solubility and chemical properties of the inhibitor  
30 selected, the chosen administration route, and standard pharmaceutical practice. The VAP-1 inhibitor may be administered orally in solid dosage forms, e.g., capsules, tablets, powders, or in liquid forms, e.g., solutions or

suspensions. The inhibitor may also be injected parenterally in the form of sterile solutions or suspensions. Solid oral forms may contain conventional excipients, for instance, lactose, sucrose, magnesium stearate, resins, and like materials. Liquid oral forms may contain various flavoring, coloring, preserving, stabilizing, solubilizing, or suspending agents. Parenteral preparations are sterile aqueous or non-aqueous solutions or suspensions which may contain certain various preserving, stabilizing, buffering, solubilizing, or suspending agents. If desired, additives, such as saline or glucose, may be added to make the solutions isotonic.

The present inventive method also can involve the co-administration of other pharmaceutically active compounds. By "co-administration" is meant administration before, concurrently with, e.g., in combination with the VAP-1 inhibitor in the same formulation or in separate formulations, or after administration of a VAP-1 inhibitor as described above. For example, corticosteroids, prednisone, methylprednisolone, dexamethasone, or triamcinolone acetinide, or noncorticosteroid anti-inflammatory compounds, such as ibuprofen or flubiprofen, can be co-administered. Similarly, vitamins and minerals, e.g., zinc, anti-oxidants, e.g., carotenoids (such as a xanthophyll carotenoid like zeaxanthin or lutein), and micronutrients can be co-administered.

In addition, the VAP-1 inhibitor according to the present invention is useful for preparing a medicament such as a therapeutic or prophylactic agent for the VAP-1 associated diseases.

5 nitrogen atmosphere. The mixture was stirred under 3 atm hydrogen for 3 hrs. at 25 °C. The reaction mixture was filtered through a celite pad, and the filtrate was concentrated in vacuo to give a crude material (192.3 mg). To the residue was added saturated sodium hydrogen carbonate  
10 aqueous solution, and the mixture was extracted with chloroform. The organic layer was washed with brine, dried over MgSO<sub>4</sub>, and concentrated in vacuo to give a pink amorphous substance (124.7 mg). The pink amorphous substance (124.7 mg), N,N'-bis(tert-butoxycarbonyl)-1H-pyrazole-1-carboxamidine  
15 (93.6 mg) and tetrahydrofuran (2 ml) were combined under nitrogen atmosphere. The reaction mixture was stirred at 25 °C for 14 hrs., and concentrated in vacuo. The residue was purified by preparative thin-layer chromatography over silica gel with chloroform / methanol (20:1) as an eluent to give di-  
20 tert-butyl ((Z)-{[4-(2-{2-(acetylamino)-5-[(4-acetyl-1-piperazinyl)methyl]-1,3-thiazol-4-yl)ethyl]phenyl}amino)methylidene)biscarbamate as colorless oil (121.1 mg).

**Example 1**

Inhibitory Effect of Compound A on VAP-1 enzyme (SSAO) activity in human and rat plasma.

VAP-1 enzyme (SSAO) activity in both human and rat plasma was determined by a radiochemical-enzyme assay using  $^{14}\text{C}$ -benzylamine as artificial substrate. The enzyme suspension prepared from blood plasma was pre-incubated with Compound A in 96-well microplate at room temperature for 30 min. The enzyme suspension was then incubated with  $^{14}\text{C}$ -benzylamine (2x10<sup>-5</sup> mol/l final concentration) in a final volume of 50  $\mu\text{l}$  at 37°C for 1 hour. The enzyme reaction was terminated by adding 2 mol/l (50  $\mu\text{l}$ ) citric acid. The oxidized products were directly extracted into a 200  $\mu\text{l}$  toluene scintillator, and its radioactivity was measured by a scintillation spectrometer. Monoamine oxidase (MAO) and diamine oxidase (DAO, histaminase) activities were also determined by similar method using  $^{14}\text{C}$ -phenylethylamine and  $^{14}\text{C}$ -putrescine as substrate, respectively. Cloned DAO from cDNA libraries was used in human DAO assay. Inhibition activity was expressed as IC<sub>50</sub> ( $\mu\text{mol/l}$ ) value.

Compound A completely inhibited the enzyme activity of human and rat plasma SSAO, but not the enzyme activities of other amine oxidases, such as human platelet MAO and cloned DAO, shown in Table 1.

**Example 2**

Effect of Compound A on ocular permeability in diabetic rats.

Diabetes in rat was induced with an intraperitoneal

(i.p.) injection of 65 mg/ml/kg of streptozotocin (STZ) in 2 mmol/l citrate buffer (pH 4.5) after a 20-h fast. At the same time control rat were injected with an equal volume of 2 mmol/l citrate buffer. Plasma glucose level was checked by a colorimetric method. At day 3 of STZ treatment, the rat was diagnosed with diabetes showing a plasma glucose level of 350 mg/dl.

The treatment of Compound A was given daily from 2 weeks after STZ treatment for 2 weeks. At 24 hrs after final treatment of Compound A, the vascular permeability in oculus was investigated based on the leakage of dye into the vitreous 30 min after intravenous injection of fluorescein solution (40 mg/ml/kg). Permeability was expressed as vitreous/plasma ratio of fluorescein concentration measured by a fluorophotometer. At the same time, the plasma SSAO activity was checked by the radiochemical-enzyme assay using  $^{14}\text{C}$ -benzylamine ( $2 \times 10^{-5}$  mol/l final concentration) as substrate.

The significant increase of ocular permeability in diabetic rats was examined at 4 weeks after treatment of STZ and compared with that of normoglycemic normal rats. The treatment of Compound A (10 mg/kg, s.c. u.i.d.) given daily from 2 weeks after STZ treatment improved the ocular permeability, in comparison with the STZ control group (Table 2). Plasma SSAO enzyme activity also increased in diabetic rats at 4 weeks after STZ treatment, but the treatment with Compound A exhibited dose-dependent inhibition of the increased plasma SSAO activity (Table 3).

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/JP2004/000708

## Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 17-23 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
